

## WIP update --- > LinkedIn Web Scraper

- I am trying to build a web scraper for LinkedIn.
- For this the plan is to use the following libraries :
  - Selenium
  - BeautifulSoup4
- Alongside this I plan to use the chrome drivers.
  
- So far, while trying to implement the above stated, I have been able to import the desired libraries.
- However after this I met with an issue with setting up the chrome drivers.
- Currently, I am trying to explore different solutions for the same.
- As far as the project goes, this is the parallel approach to Indeed scraping which has been implemented successfully.
- Hence we have the data and can proceed with the second step of model building.
